This q		notes, but do not use a computer.	a and the hours of
the rec	•	top of each page, and your user name irst page. Answer all questions in the e or False (15 points)	
	1.1. In Python the values	of a dict must be immutable.	
	1.2. There exist problems iteration or recursion.	that cannot be solved in Python w	ithout using either
	1.3. Floating point arithm numbers.	etic behaves exactly like normal arith	hmetic on real
	1.4. On all inputs, a bisec	tion search will run faster than a line	ar search.
		element of which is a list of ints. In F [0] [0] = 3 mutates the list L.	Python, the

2) What does the following code print? (10 points)

```
T = (0.1, 0.1)
x = 0.0
for i in range(len(T)):
    for j in T:
        x += i + j
        print x
print i
```

3) What does the following code print? (10 points)

```
def f(s):
    if len(s) <= 1:
        return s
    return f(f(s[1:])) + s[0] #Note double recursion

print f('mat')
print f('math')</pre>
```

4) Implement the body of the function specified in the box. (18 points)

def findAll(wordList, 1Str): """assumes: wordList is a list of words in lowercase. 1Str is a str of lowercase letters. No letter occurs in 1Str more than once returns: a list of all the words in wordList that contain each of the letters in 1Str exactly once and no letters not in lStr."""

5) The following code does not meet its specification. Correct it. (8 points)

```
def addVectors(v1, v2):
    """assumes v1 and v2 are lists of ints.
    Returns a list containing the pointwise sum of
    the elements in v1 and v2. For example,
    addVectors([4,5], [1,2,3]) returns [5,7,3],and
    addVectors([], []) returns []. Does not modify inputs."""
    if len(v1) > len(v2):
        result = v1
        other = v2
    else:
        result = v2
        other = v1
    for i in range(len(other)):
        result[i] += other[i]
    return result
```

6) Consider the following code:

```
def f(s, d):
    for k in d.keys():
        d[k] = 0
    for c in s:
        if c in d:
            d[c] += 1
        else: d[c] = 0
    return d
def addUp(d):
    result = 0
    for k in d:
       result += d[k]
    return result
d1 = {}
d2 = d1
d1 = f('abbc', d1)
print addUp(d1)
d2 = f('bbcaa', d2)
print addUp(d2)
print f('', {})
print result
```

6.1) What does it print? (9 points)

l				
l				
l				
l				
l				
l				
l				
l				
l				
l				
ı	1			

6.2) Does it terminate normally? Why or why not? (4 points)

7) Consider the following code:

```
def logBase2(n):
    """assumes that n is a positive int
       returns a float that approximates the log base 2 of n"""
    import math
    return math.log(n, 2)
def f(n):
    """assumes n is an int"""
    if n < 1:
       return
    curDigit = int(logBase2(n))
    ans = 'n = '
    while curDigit >= 0:
        if n%(2**curDigit) < n:
            ans = ans + '1'
           n = n - 2**curDigit
        else:
            ans = ans + '0'
        curDigit -= 1
    return ans
for i in range(3):
    print f(i)
```

7.1) What does it print? (10 points)

7.2) Under the assumption that logBase2 is O(n), what is the order (use big Oh notation) of f? (5 points)

8) Next to each item in the left column write the letter labeling the item in the right column that
best matches the item in the left column. No item in the right column should be used more than
once. (9 points)

Big O notation	a) induction
Newton's method	b) upper bound
recursion	c) lower bound

- d) approximation
- e) expected running time
- f) exponential
- 9. Do you think that the lectures are too slow paced, too fast paced, about right? (1 point)
- 10. Do you think that the problem sets are too easy, too hard, about right? (1 point)
